CULTURAL HUMILITY AND COVID-19

GENERAL CULTURAL TOOLS

Cultural Formulation Interview
(Found inside DSM)

According to the APA, different cultures and communities exhibit or explain symptoms in various ways. Because of this, it is important for clinicians to be aware of relevant contextual information stemming from a patient’s culture, race, ethnicity, religion or geographical origin.

The CFI can be used to explore cultural information by any and all service providers.

Consider the following questions found in the CFI:
- How has COVID-19 affected your ability to take part in community and social activities?
- How has the pandemic affected your ability to enjoy everyday life?
- How has [NAME(S) OF SPIRITUAL, RELIGIOUS OR MORAL TRADITION(S)] helped you cope with the pandemic?
- Have you talked to a leader, teacher or others in your [NAME(S) OF SPIRITUAL, RELIGIOUS OR MORAL TRADITION(S)] community, about COVID-19? How have you found that helpful?
- Have you found reading or studying [BOOK(S) OF SPIRITUAL, RELIGIOUS OR MORAL TRADITION(S)], (E.G. BIBLE, KORAN], or listening to programs related to [NAME(S) OF SPIRITUAL, RELIGIOUS OR MORAL TRADITION(S)] on TV, radio, the Internet or other media [e.g., DVD, tape] to be helpful? In what way?
- Have you found any practices related to [NAME(S) OF SPIRITUAL, RELIGIOUS OR MORAL TRADITION(S)], like prayer, meditation, rituals, or pilgrimages to be helpful to you in dealing with the pandemic? In what way?

SAMHSA Cultural Competence Recommendations

"The National CLAS Standards are intended to advance health equity, improve quality, and help eliminate health care disparities by establishing a blueprint for health and health care organizations"

Remember, evidence based practices aren’t always effective across cultural groups. Consider:
COVID-19 Considerations

COVID-19 could adversely affect the lives and livelihoods of the LGBTQ community at disproportionate rates. Consider your LGBTQ individuals Telehealth environment, they may not be out to those they are sheltered with. Human Rights Campaign has identified the following considerations regarding COVID-19:

- Increased exposure to the virus as many within the LGBTQ community work in highly affected areas
- Economic disparities and barriers to care exist
- Health coverage gaps exist
  - LGBTQ individuals less likely to be covered by health care than non-LGBTQ individuals
- Paid leave is not available to many
  - LGBTQ policies in the work-force are under-inclusive at best
- Older individuals within the LGBTQ community and LGBTQ youth face unique challenges

17% of LGBTQ Adults do not have any kind of health insurance coverage

12% of non-LGBTQ Adults do not have any kind of health insurance coverage

37% of LGBTQ Adults smoke everyday

27% of non-LGBTQ Adults smoke everyday

Reach out to LGBTQ individuals, they may not reach out to you!

Trans Lifeline
Dial 877-565-8860
Trans Lifeline’s Hotline is a peer support service run by trans people, for trans and questioning callers.
Black and African American Community

Misinformation has been circulating inaccurately expressing that Black and African American individuals are immune from COVID-19. According to the US Surgeon General Jerome Adams, African Americans may be infected and dying of COVID-19 at higher rates.

Within Normal Limits Considerations

- Environmental, economic, and political factors have compounded for generations, putting African Americans at higher risk of chronic conditions that leave lungs weak and immune systems vulnerable: asthma, heart disease, hypertension and diabetes.
- Black/African Americans may be triggered by recent government restrictions including racial bias in the medical systems, historical instances of segregation, mass incarceration, and other racial injustices on a systemic level.
- The Tuskegee Effect in which African Americans are reluctant to seek medical attention due to historical distrust of healthcare institutions may prevent AA from getting tested despite exhibiting symptoms of COVID-19.
- As participating in faith communities may be a coping skill, members of the community may need to explore virtual resources to stay connected.
- Members of the community may need to be reminded self-preservation is a form of self-care - not self-indulgence.
- Black And Hispanic Workers Much Less Likely To Work From Home

African American males report fear of consequences of people’s implicit bias wearing masks amid COVID-19

18% of people testing positive for COVID-19 were Black, African Americans (CDC, 4/4/2020)

33% of people hospitalized due to COVID-19 were Black, African Americans (CDC, 4/4/2020)

Preliminary data indicates Black African Americans are dying at higher rates of COVID-19 due to racial health inequities

Asian and Pacific Islander Community

Although COVID-19 does not discriminate, hate crimes as a result of Xenophobia and Racism have heightened as a result of this pandemic. As a result fear (in addition to the stress, worry, and anxiety due to COVID) may be experienced by members of this community. The individuals we serve can report hate crimes [here](#). Consider how family dynamics that were already challenging prior to COVID-19 can be impacted due to close, long contact due to sheltering in place. The environment of Telehealth services should also be considered for individuals who may be surrounded by family. In addition, members of the API community may experience reluctance in seeking medical attention despite exhibiting COVID-19 symptoms due to potential discrimination and immigration status.

Incidents of Coronavirus Discrimination Report

Asian American Psychological Association (AAPA) made the following recommendations in response to COVID-19:

Correct anyone who mislabels the virus and pandemic and encourage them to instead use the terms COVID-19 or coronavirus.

Educate our colleagues, students, and others in our networks about the historical and structural factors that have seeded the racism and xenophobia Asian Americans are currently facing: the interconnectedness of current anti-Asian racism with historical and current oppression experienced by other marginalized communities and the impact of racism and xenophobia on mental health and well-being.

Report incidents of hate through the Asian American and Pacific Islander Planning Council’s online incident report portal (available in English, Chinese (traditional and simplified), Korean, Thai, Japanese, Korean, and Khmer); the STOP AAPI Hate Reporting Center: Resist attempts to divide Asian American communities from other communities who also face racism and discrimination. This is an opportune time for us to ally with other communities and recognize our shared struggles for liberation.

Engage in self-care and radical healing.

“listen to API clients’ fear and encourage them to report any hate incidents”

According to the Center for American Indian Health, COVID-19 poses critical concerns to Native American communities. Prior to this pandemic, Native Americans already had higher rates of infectious disease severity and death than any other population in the U.S. Many of the Native peoples we serve live in crowded, multi-generational homes; effective home isolation for those at highest risk will be very difficult. Food and water insecurity already impacts 25-40% in many rural tribal communities. Estimates indicate that more than 80% of children in many communities rely on getting their breakfast and lunch at schools that have been closed. For many families, the COVID-19 pandemic will be devastating, economically and otherwise.

Health disparities including high rates of diabetes, cancer, heart disease and asthma may increase the risk for Native Americans. This combined with elder populations who may be sheltering with exposed individuals increases the chances of suffering. Due to the historical impact of pandemics and a preference for natural community care models, Native Americans may not seek medical attention from doctors or hospitals. The Native American community values caring for elders and many may experience compounded stress for keeping elders and other family members safe.

Latinx and Hispanic Communities
How COVID-19 Stress may Manifest

National Hispanic and Latino MHTTCN list the following considerations for how Hispanic and Latinx individuals may experience stress:
- In the form of body pains such as backaches, headaches or stomach aches.
- May describe symptoms of feeling tired, having changes in their sleeping or eating patterns, feeling nervous and/or restless.
- May believe symptoms are caused by outside environmental, spiritual or personal problems.
- May view medication as addictive and harmful.
- Social isolation and quarantine may exacerbate stress already experienced.
- May increase use of alcohol, tobacco and other substances
- Increased sense of loss
- Loss of normal coping and enjoyable activities

Some Latino cultural groups believe in spiritual causality of emotional and psychological suffering (“why is God punishing me?”). Troubles may be attributed to moral conflicts, guilt and shame over poor judgment, punishment from God for one’s ancestors’ indiscretions, or simply fatalism. Individuals from the community may seek spiritual or other healers as a first step in seeking help for their symptoms. Members from the community may be more likely to:
- Visit the doctor when something is wrong and when pain is unbearable.
- See medical (and mental health) professionals as authority figures and are less likely to overtly disagree or express discomfort with a treatment plan.
- Seek help from a medical professional than a psychologist or psychiatrist due to stigma associated with receiving mental health treatment. (Consider the risks of going to the doctor during the pandemic)

Members of Hispanic and Latinx communities may be more worried about the economic impact of COVID-19 than other Americans. The pandemic is impacting the Central Valley’s Farmworkers as many face the difficult decision to isolate or make money.

Stress Management Recommendations
- Psychoeducation about COVID-19
- Understand cultural factors that influence view of stress
- Acknowledge aspects of diversity within the culture in provision of services
- Assist individuals with a plan to stay connected and supported
- Consider the use of storytelling and pláticas/informal conversations
- Consider the use of Dichos-Sayings/Proverbs
- Normalize and validate feelings of stress, anxiety and fear
